/lab_host="E. coli BM25.8"

//note="Organ: shoot tips: Vector: Lambda TriplEx; Site_1:
SfiI (A): Site_2: SfiI (B): Shoot tips (approx. 2 cm from
apex) were collected during the spring, frozen and used
for mRNA isolation. The SMARY-PCR method (Clontech) was
used to prepare a library from 1 ug total RNA, using the
Lambda TriplEx vector. Plasmid subclones in pTriplEx were
recovered by cre-lox excision in E. coli strain BM25.8 and

       This sequence represents a Leptospira DNA sequence isolated from the pathogenic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species. L. fainei. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for detection and diagnosis of past or present LS infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a Leptospira DNA sequence isolated from the pathogenic Leptospira (LS) bacterium of the invention.                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a Leptospira DNA sequence isolated from the pathogenic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species L. fainei. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for detection and

                                                                                                                                                                                                                                                                                                                  This DNA sequence comprises the maize 233 Zm41-A gene. This is an orthologue of Arabidopsis Ms41-A (see 190522), a gene that confers male fertility. It was obtained following a database search for sequences that showed homology to Ms41-A DNA, isolation of a partial cDNA clone, and use of this clone to isolate Zm41-A genes 231 (190542), Z33 (190543) and 235 (190544) from genomic lambda ilbraries. The genes show a high level of conservation. Z35 may be derived from Z31 via genetic rearrangements, deletions and/or insertions. Z33 has subsequent deletions from Z35 and is truncated, having only exons 3, 5 and 6. The Ms41-A and Zm41-A cransgenic plants with controlled male fertility. Male sterile plants with controlled male fertility. Male sterile plants where restoration of fertility is not needed, e.g.

Human secreted protein gene 126 clone HELGH31.

19-JAN-1999 (first entry)

V59636;

V59636 standard; DNA; 1291 BP

RESULT V59636/c

```
The invention relates to nucleic acid sequences (V84411 to V84633)

cenceding human secreted proteins (W88534 to W88756). The secreted protein

ce gene sequences are depocated with the ATCC under deposit numbers ATCC

209011, 209080, 209081, 209082, 209008, 209009, 209010, 209011, 209080, 209011, 209080, 209081, 209084, 209085, 209011. Host

cc cells compressing recombinant vectors containing the nucleic acid

sequences are used for the recombinant production of the secreted

crefil for preventing, treating or ameliorating medical conditions e.g.

by determining the amount of the new polypeptides in a sample or by

cc by determining the presence of mutations in the new polynucleotides.

by determining the presence of mutations in the new polynucleotides.

compressing the presence of mutations in the new polynucleotides, based on

which tissues they are most highly expressed in, and include developing

cc specific uses are described for each of the polynucleotides, based on

which tissues they are most highly expressed in, and include developing

createnosis, hepatic and renal diseases, lymphomas, inflammation, allergies,

clischemic shock, Alzateimer's and cognitive disorders, schizophrenia,

createnosis, prostate diseases, obesity, disorders involving osteoclasts

cut has osteoporosis, arthritis or malignancies, diseases of testes, lung

cort thymus, dispersive/endocrine disorders, infections and AIDS. The

colypeptides are also useful for identifying their binding partners.

The present sequence represents a gene encoding a human secreted protein

createnosis, requence represents and clone identification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                              Endress GA;

```
209048) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Pc portion (e.g. v59501) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V95311.V5901; amino acid sequences W74731-W75056) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see V55511 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antigenic protein; vaccine; Lyme disease; infection; detection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated Borrelia burgdorferi nucleic acids - used to develop products for the diagnosis, prevention and treatment of diseases caused by Borrelia, particularly Lyme disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence encodes a maize acetyl-CoA-carboxylase (ACCase, EC-6.4.1.2) fragment. The enzyme catalyses the formation of malonyl-CoA from acetyl-CoA and bicarbonate, and requires a biotin prosthetic group for activity. The enzyme is inhibited by several herbicides (e.g. fluazifop and sethoxydim) in monocotyledons. The sequence is a 2-kb EcoRI fragment of phage lambda-q11 clone 15-14, 190lated from a maize inbred A188 seedling CDNA library by screening with malze ACCase antiserum. Probes generated from the transcarboxylase active site domain (T17112) and the biotin binding site domain (T17112) and the biotin binding for similar genes. An expression cassette containing the gene, a mutant or an antisense DNA sequence may be combined with a plant

Clone #15-14 was isolated from a lambda gtll cDNA library of maize inbred A188 seedlings by screening with maize ACCase antiserum. Other ACCase DNA fragments (see also 79906-16) and a complete cDNA (T39905) coding fragments (W0550) have also been isolated. ACCase DNA fragments isolated. ACCase DNA fragments are also been isolated. ACCase DNA fragments are also been isolated.
                                                                                                                                                                                                                                                                                                                                                    Gaps
promoter, e.g. a cauliflower-mosaic virus 35S promoter or nopaline-synthase promoter, and N-terminal maize chloroplast transit peptide sequence in a plasmid vector for high-level tissue-specific gene expression, to confer herbicide resistance and/or alter the oil content of the plant, or to increase the plant AcCase yield, so that the crystallized enzyme may be used to screen and identify other herbicides that bind to and inhibit the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding maize acetyl coenzyme A carboxylase gene · used for prodn. of plants with herbicide tolerance or altered oil content

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present DNA sequence is a 2kb EcoRI fragment of lamda clone #15-14 including a portion of a maize acetyl CoA carboxylase (ACGSse) gene located at bases 2883 to 83 from the 3' stop codon. AcGase is involved in fatty acid synthesis and is the target of the specified herbicides. Transformation of plants with ACGSse imparts resistance to cyclohexanedione and aryloxyphenorypropanoic acid herbicides and alter the oil content. The ACGASe DNA is also used as source of probes and primers for the identification of transgenic plants; in marker-assisted plant selection and for restriction fragment length polymorphism mapping, used for high-energy animal feed and high-fiber, low-fat human food and in genetic dissection of the groat oil trait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New DNA encoding acetyl-CoA carboxylase from oats, used to produce transformed plants with herbicide resistance and altered oil content

This DNA, isolated from Mycobacterium leprae, encodes a precursor (immature) gyrase protein from which an "intein" (see W15074) is excised during maturation. The gyrase and its coding sequence are useful to fabricate products that alter the maturation of proteins essential for the development of infectious agents by altering the protein splicing of precursor polypeptides of the proteins. The inteins encoded by the gyra genes of Mycobacterium leprae, M. flavescens, M. gordonea and M. kanassii are used: (a) to modify the genome of a eukaryotic cell that lacks endogenous biological activity identical to that of the polypeptide; (b) to replace a copy of a gene present in a recipient genome by integration of a gene different from that where the integration takes place; and (c) for targetted insertion of a foreign by sequence into a selected site in the genome of a eukaryotic cell not containing the

```
une sequence is used to line As accept con carboxylase (Accase) CUNA maize clone which can be used to probe plant DNA to isolate other such clones. It may be used with plant regulatory sequences to produce expression cassettes for Accase. These cassettes are used to renaposition of seeds or Accase. These cassettes are used to transform plants to downregulate produc of Accase. This can alter the composition of seeds or other plant parts, e.g. enabling oilbearing plants such as oilseed rape, sunflower or oilpalm, having a lower or modified oil content to be produced. It can be used to form expression cassettes for overexpression of Accase, leading to produce of plants with an increased oil content. It may also be used to form expression cassettes for overexpression of Accase, leading to produce of plants with an increased oil content. It may also be used to recover the Accase expression. Monocotyledonous plants can be made tissue-specific or developmentally regulated manner, and this RNA used to inhibit Accase expression. Monocotyledonous plants can be made tesistant to grass weed herbicides adopted to express Accase. This is acheived by overexpression of monocot Accase, expression of dicot Accase (which is relatively tolerant to these herbicides used to provides crop plants which are resistant to herbicides used to provides crop plants which are resistant to herbicides used to applic where there has been short term carryover of herbicide from the provides crop. Using the method, weeds such as wild oats may be controlled, and the farmer is given extra options to obtain an improved harvest using means which are safer, chaaper or more effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of the A3 acetyl coA carboxylase (ACCase) cDNA

The complete sequence was deduced from cDNA cloue #18-5, obtd. from a lambda gtll cDNA library of maize inbred A188 seedlings, and from PCR amplifications (see also T39918-23). Genomic ACCase DNA fragments have also been isolated (see also T39906-16). ACCase DNA herbicide tolerance or oil content of a transgenic plant, or used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

CDS
This cDNA encodes a maize ACCase enzyme. This can be used in a method of preparing an herbicide resistant corn plant to a second corn plant comprises at least 1 herbicide resistant.

C. where the first corn plant comprises at least 1 herbicide resistant allele and the second plant comprises at least 1 herbicide resistant to allele which is not allelic to the herbicide resistant allele present in the first plant. The herbicide resistant corn plants are prepared using Accl and Acc2 gene combinations which impart cylcohexanedione (CHD) or aryloxyphenoxypropanoic acid (APA) herbicide tolerance to the corn plant. The methods are used to impart CHD and APA herbicide tolerance to corn plant. The methods are used to impart CHD and herbicide tolerance to corn plant. The methods are also be used to impart tolerance to a corn plant also be used to impart tolerance to a corn plant to an agent which inhibits acetyl CACA and corn plant to an agent which inhibits acetyloxylase, selected from to all to prophenyl) perhydroindolizine-2,4 dione, 3-isopropyl-6-

                                                        The present cDNA sequence encodes maize acetyl CoA carboxylase (ACCase). ACCase is involved in fatty acid synthesis and is the target of the specified herbicides. Transformation of plants with ACCase imparts resistance to cyclohexanedione and aryloxyphenoxypropanoic acid herbicides and alter the oil content. The ACCase DNA is also used as source of probes and primers for the identification of transgenic plants; in marker-assisted plant selection and for restriction fragment length polymorphism mapping, used for high-energy animal feed and high-fiber, low-fat human food and in genetic dissection of the groat

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, Al

round of Poly(A)+ selection using Oligotex (Qiagen). CDN
library constructed using Stratagene ZAP-CDNA syntesis
kit. Oligo df-primed, size fractionated -1-6 kb, and
directionally cloned at EcoRI and XhoI in Uni-ZAP XR.
Following a single round of amplification pBlueScript SK
phagemids were mass excised. A distribution channel for
clones is being sought, but not currently available.
Requests for clones cannot be honored."

/lab_host="E. coll strain SOLR"
/lab_host="E. coll strain SOLR"
/note="Vector: pBluescript SK +/-: Site_1: EcoRI: Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA from the
mixture of cotyledons of five days old plants and leaves
of two weeks old plants. The cDNA was directionally
ligated into the Uni-ZAP XR vector from Stratagene and
packaged using Glapack III Gold packaging extracts.
Plasmids containing cDNA inserts were excised from the
recombinant lambda-ZAP phage using Ex-Assist helper phage
and propagated in SOLR cells."

/dev_stage="mixture of cotyledons from five days old
plants and leaves obtained from two weeks old plants"
/lab host="E. col! strain SOLR"
/note="vector: pBluescript SK +/-; Site_1: EcoRI; Site_2:
xhoi; cDNA was prepared from polyA+ enriched RNA from the
mixture of cotyledons of five days old plants and leaves
of two weeks old plants. The cDNA was directionally
ligated into the Uni-ZAP XR vector from Stratagene and
packaged using Gigapack III Gold packaging extracts.
Plasmids containing cDNA inserts were excised from the
recombinant lambda-ZAP phage using Ex-Assist helper phage
and propagated in SOLR cells."

/note="vector: Lambda Uni-24P RR (Stratagene); Site_1:
ECORI, Site_2: Xho!: mRNA was purified from 2 x 10E3
rhabditiform larvae which had been isolated from gerbils experimentally infected dogs. cDNA was constructed and, using adaptors, was cloned unidirectionally into the vector from the ECORI site to the Xho! site. The library has an unamplified titer of 1 x 10E5 pfu/ml and an amplified, undiluted titer of 9 x 10E11 pfu/ml. The average insert size of the unamplified library is 675 bp (range, 100-1700)."
